Backend / Data Platform Engineer — Observability & Test Automation

MonoEdge · Pune (with occasional travel to customer sites)
Full-time · Early-career / experienced · strong graduates welcome

About MonoEdge

MonoEdge builds an advanced intelligence layer for the Indian mid-market manufacturing sector. Our software behaves like an always-on analyst rather than another dashboard: it reads what is happening across a plant, connects production data to quality, energy, and cost, and tells the people running the floor what is going wrong and why.

We are a technically-driven, bootstrapped company defining a new category in industrial optimization.

About the role

Everything the product shows a customer — every alert, report, and answer — runs through backend services and a data platform that has to keep working while factory data pours in at all hours. When a source goes quiet, a pipeline stalls, or a service slows down, we need to know before the customer does. And because the platform carries real production data, we cannot ship changes on hope — we need automated tests that exercise the system continuously and catch a regression before it reaches a plant.

As a Backend / Data Platform Engineer, you will build the services and data platform behind the product **and own the two things that keep it trustworthy: observability and automated testing**. You will make the system legible — metrics, logs, traces, alerts — and make it safe to change — test suites and CI automation that continuously prove the data flows still work. It is foundational, sometimes unglamorous, and it is what lets everything above it move fast without breaking.

What you will do

- **Build backend services and APIs** — the services that ingest, process, and serve plant data to the product, written to be clean, well-typed, and maintainable by a small team.
- **Build and run the data platform** — pipelines and jobs that move data from ingestion through processing to the tables the product and the analytics team query, designed to recover from failure and to raise an alert when a source stops sending.
- **Own the observability stack** — metrics, structured logging, and distributed tracing (Prometheus / Grafana / OpenTelemetry, or similar) so that when something is slow or wrong, you can see where and why, and the right person is paged.
- **Build test automation** — unit, integration, and end-to-end suites, plus data-quality and contract tests that continuously exercise the pipelines and services with realistic data, so a regression is caught in CI, not in production.

- **Wire tests into CI/CD** — make the test suites fast and reliable enough that every change runs them, and a red build actually means something.
- **Own reliability of data flows** — define what "healthy" looks like for each pipeline, instrument it, set the alerts, and close the loop when something drifts or breaks.
- **Partner with the data, AI, and frontend teams** — the services you build are the boundary they all depend on, so you will shape clean, well-documented contracts.

Who should apply

We are looking for an engineer who takes quiet pride in systems that stay up and changes that do not break things — someone who reaches for a test and a metric by instinct. The exact degree matters less than what you have built and how you reason about reliability.

You are a strong fit if you have:

- **Strong backend fundamentals** in Python (or a comparable language): you can design and build an API or a service, model data sensibly, and write code a small team can maintain.
- Solid **SQL and data sense** — you can design a schema, reason about a join, and think about how data moves through a system, not just how one query runs.
- A genuine **testing instinct**: you have written real test suites, you know the difference between a test that proves something and one that just runs, and you have wired tests into CI.
- An **observability mindset**: you care whether a job ran, whether it ran correctly, and how you would know if it did not — and you have used or built metrics, logs, or traces to answer that.
- A **reliability temperament** — when something breaks, you want a system that told you first, and a test that stops it happening again.
- Something to show: a service, a pipeline, a test harness, or a monitoring setup you built and can walk us through.

Nice to have (none required): experience with an observability stack (Prometheus, Grafana, OpenTelemetry, ELK, Sentry); CI/CD systems (GitHub Actions or similar); containers (Docker); message queues or streaming; time-series or industrial data; test frameworks (pytest, and integration / e2e tooling); Postgres, a time-series DB, or a warehouse; Linux and the command line.

> **A note on marks:** we do not screen on CGPA alone. A service or pipeline you built — with the tests and monitoring that keep it honest — counts for more than a decimal point.

What you will learn and why join

- Ownership of the platform that everything else at MonoEdge runs on, working directly with the **Founder and senior engineers**.
- How to build and operate reliable data systems on genuinely hard, real-world industrial data — with the observability and testing discipline that makes them trustworthy.
- A small, bootstrapped team where the services you build are used almost immediately.

Details

Location	Pune, with occasional travel to customer sites
Type	Full-time
Reports to	Founder and senior team
Eligibility	Any engineering discipline or related field; demonstrable backend / data / testing project work

Selection process

1. **Email your CV** to krishna@monoedge.in with the role in the subject line. This role does not have a public application page yet.
2. **Screening call** with the team.
3. **Technical discussion** — backend and data design, a real testing or reliability problem, and how you would instrument and monitor a service. We are interested in how you think, not trick questions.
4. **Conversation with the Founder.**

How to apply

Email your CV to **krishna@monoedge.in** with the role in the subject line. This role does not have a public application page yet.

Placement cells and college partners: you are welcome to share that email with students. For campus drives or to schedule a session, please reach out to us at the contact below.
