Data Engineer (Graduate)

MonoEdge · Pune (with occasional travel to customer sites)
Full-time · Graduate / entry-level · 2025 and 2026 graduates

About MonoEdge

MonoEdge builds an advanced intelligence layer for the Indian mid-market manufacturing sector. Our software behaves like an always-on analyst rather than another dashboard: it reads what is happening across a plant, connects production data to quality, energy, and cost, and tells the people running the floor what is going wrong and why — in English, Hindi, and Marathi.

We are a technically-driven, bootstrapped company defining a new category in industrial optimization.

About the role

Every model, every report, every answer our product gives sits on top of data — and in a factory that data is a mess. PLCs stream at 10 to 100 Hz, the lab records once a shift, the ERP updates once a day, units are inconsistent, tags are undocumented, and sources go quiet without warning.

As a Data Engineer, you will build the layer that turns all of that into something clean, joined, and queryable — the foundation the data scientists and our product rely on. It is foundational, unglamorous, and genuinely hard, and getting it right is what makes everything above it possible.

What you will do

- **Ingest data** from many sources — PLC and sensor streams (OPC UA, Modbus), lab systems, ERP exports, and flat files — each on its own schedule and format.
- **Clean and validate** — handle missing values, unit mismatches, duplicates, and silent gaps, and catch bad data before it reaches a model or a report.
- **Join heterogeneous sources** — align data recorded at very different frequencies and timestamps into tables that can actually be analysed together.
- **Shape storage and access** — design how time-series and relational data are stored so queries are fast and the schema makes sense.
- **Build reliable pipelines** — jobs that run on a schedule, recover from failure, and raise an alert when a source stops sending data.
- **Support the analytics team** — give the data scientists the clean, joined tables they need, in the shape they need them.

Who should apply

We are looking for a recent graduate in **any engineering discipline or a related field**. What matters is comfort with data and code, not the exact branch.

You are a strong fit if you have:

- Solid **Python and SQL**: you can write a script that reads, transforms, and writes data, and query a database confidently. You can reason about a join, not just run one.
- A feel for **data structure**: tables, keys, and types, and why a well-shaped schema saves everyone downstream a lot of pain.
- **Patience with messy data** — missing values, inconsistent units, undocumented sources. You fix it methodically and know that most of the work is here.
- A **reliability mindset**: you care whether a job ran, whether it ran correctly, and how you would know if it did not.
- Something to show: a project where you moved or wrangled real data — a scraper, an ETL script, a dataset you cleaned and analysed.

Nice to have (none required): any exposure to time-series or industrial data; familiarity with a workflow/scheduling tool (Airflow, cron); comfort with pandas and databases beyond a single table (Postgres, a time-series DB, a warehouse); basic cloud or Linux comfort; Git and the command line.

> **A note on marks:** we do not screen on CGPA alone. A project where you tamed messy data, and clear thinking in the interview, count for more than a decimal point.

What you will learn and why join

- How data engineering works on genuinely hard, real-world data — the kind with no schema and no documentation — from a senior team that builds analytics and machine learning on top of what you produce.
- Real ownership of the data layer early, working directly with the **Founder and senior engineers**.
- A small, bootstrapped team where the tables you build are used almost immediately.

Details

Location	Pune, with occasional travel to customer sites
Type	Full-time, graduate / entry-level
Reports to	Founder and senior team
Eligibility	2025 and 2026 graduates; any engineering discipline; basic coding knowledge

Selection process

1. **Apply online** through the role page (link below) — about ten minutes: your details, a few short screening questions, and one written question we read properly.
2. **Screening call** with the team.
3. **Technical discussion** — SQL, data modelling, and a real data-cleaning problem. We are interested in how you think, not trick questions.

4. **Conversation with the Founder.**

How to apply

Apply online: **https://careers.monoedge.in/data-engineer-b4e8c1/**

Or email your CV to **krishna@monoedge.in** with the role in the subject line.

Placement cells and college partners: you are welcome to share the link above directly with students. For campus drives or to schedule a session, please reach out to us at the contact below.
