Graduate Engineer — Operations Intelligence (Business Brain)

MonoEdge · Pune (with frequent travel to customer sites across India)
Full-time · Graduate / entry-level · 2025 and 2026 graduates

About MonoEdge

MonoEdge builds an advanced intelligence layer for the Indian mid-market manufacturing sector. Our software behaves like an always-on analyst rather than another dashboard: it reads what is happening across a plant, connects production data to quality, energy, and cost, and tells the people running the floor what is going wrong and why — in English, Hindi, and Marathi.

We are a technically-driven, bootstrapped company defining a new category in industrial optimization. The person we hire will help take our core product, the *Operations Intelligence (Business Brain)*, live on real factory floors.

About the role

The Operations Intelligence (Business Brain) is the decision layer of our product. None of it matters until it is running on a real line — and this role is how it gets there.

As a Graduate Engineer, you will travel to customer plants, stand our system up alongside their machines and automation partners, connect it to their PLCs, and then stay close to the data it produces to make sure the answers it gives are true. It is a hands-on, travelling role for someone who is as comfortable reading a PLC tag list as they are opening a dataset and asking why a number moved.

This is a rare opportunity for a fresher to see the whole arc — from a raw signal on a factory floor to a decision a plant owner acts on — while learning industrial automation, real data analytics, and applied machine learning from a senior team that has shipped all three.

What you will do

- **Deploy on-site.** Travel to customer plants, set up our hardware and software next to live production, and get the Operations Intelligence (Business Brain) reading real data within days.
- **Work with PLCs and automation partners.** Coordinate with the customer's controls team and their automation vendors to read the right tags over OPC UA / Modbus, agree on what each signal means, and integrate cleanly without disrupting the line.
- **Run root cause analysis.** When rejects spike or a batch goes bad, dig into the data with the plant team to find the actual cause, not the first plausible story.
- **Do data analytics.** Pull, clean, and join messy industrial data; build the charts and summaries that make a problem legible; and check that what the system reports matches what the floor sees.
- **Support the machine learning work.** Help the senior team prepare labelled data, sanity-check model predictions against ground truth, and flag when a model has drifted in production.

- **Write things down.** Document what you learn at each site so the next deployment is faster than the last.

Who should apply

We are looking for a recent graduate in **any engineering discipline**. What matters is the mix of the physical and the analytical, not the exact branch.

You are a strong fit if you have:

- A genuine willingness to travel and to work on a plant floor — hot, loud, and unglamorous. Spending a week commissioning a system at a factory should sound good, not off-putting.
- Some basic coding knowledge: you can write a simple **Python** script and are comfortable working with data. Production-grade software experience is not required — the willingness to learn matters more.
- A basic, honest grasp of **machine learning**: training vs. testing, overfitting, and why a model that scores well on paper can still be wrong on the floor. Depth is not expected — curiosity and clear thinking are.
- A root-cause temperament: when something breaks, you want to know why, and you keep asking until the explanation actually fits the evidence.
- Clear communication in English, and ideally Hindi or Marathi, so you can talk to a shift supervisor and a founder in the same day.

Nice to have (none of these are required): any exposure to PLCs, SCADA, OPC UA, or Modbus; a final-year or personal project in data analytics or machine learning; time spent in a factory, workshop, or industrial internship; familiarity with Git and the command line.

> **A note on marks:** we do not screen on CGPA alone. A strong project you can explain, and clear thinking in the interview, count for more than a decimal point.

What you will learn and why join

- Direct work with the **Founder and senior engineers**, with real responsibility from the start.
- End-to-end exposure to **industrial automation, data analytics, and applied ML** — a combination that is hard to get anywhere as a fresher.
- A small, bootstrapped team where your work reaches a real customer quickly.
- We will invest in your growth.

Details

Location	Pune, with frequent travel to customer plants and automation partners across India
Type	Full-time, graduate / entry-level
Reports to	Founder and senior team

Eligibility	2025 and 2026 graduates; any engineering discipline; basic coding knowledge

Selection process

1. **Apply online** through the role page (link below) — it takes about ten minutes: your details, a few short screening questions, and one written question we read properly.
2. **Screening call** with the team.
3. **Technical + aptitude discussion** covering data analytics, basic ML, and a root-cause problem — we are interested in how you think, not in trick questions.
4. **Conversation with the Founder.**

How to apply

Apply online: **https://careers.monoedge.in/business-brain-associate-5c1a7e/**

Or email your CV to **krishna@monoedge.in** with the role in the subject line.

Placement cells and college partners: you are welcome to share the link above directly with students. For campus drives or to schedule a session, please reach out to us at the contact below.
